

AI Text-to-Video Generator Workflow

How the components connect in a node-based pipeline

How to Tell Which Nodes Connect

- Match output type to the same input type.
- Read the port labels on both nodes.
- The sampler usually needs: **MODEL + CONDITIONING + LATENT**.
- Decoders turn **LATENT** into **IMAGE / FRAMES**.
- Video output nodes expect **FRAMES** or a video stream.
- If the port type is wrong, the nodes will not connect.

Quick Connection Logic
